

Do Two Things At Once

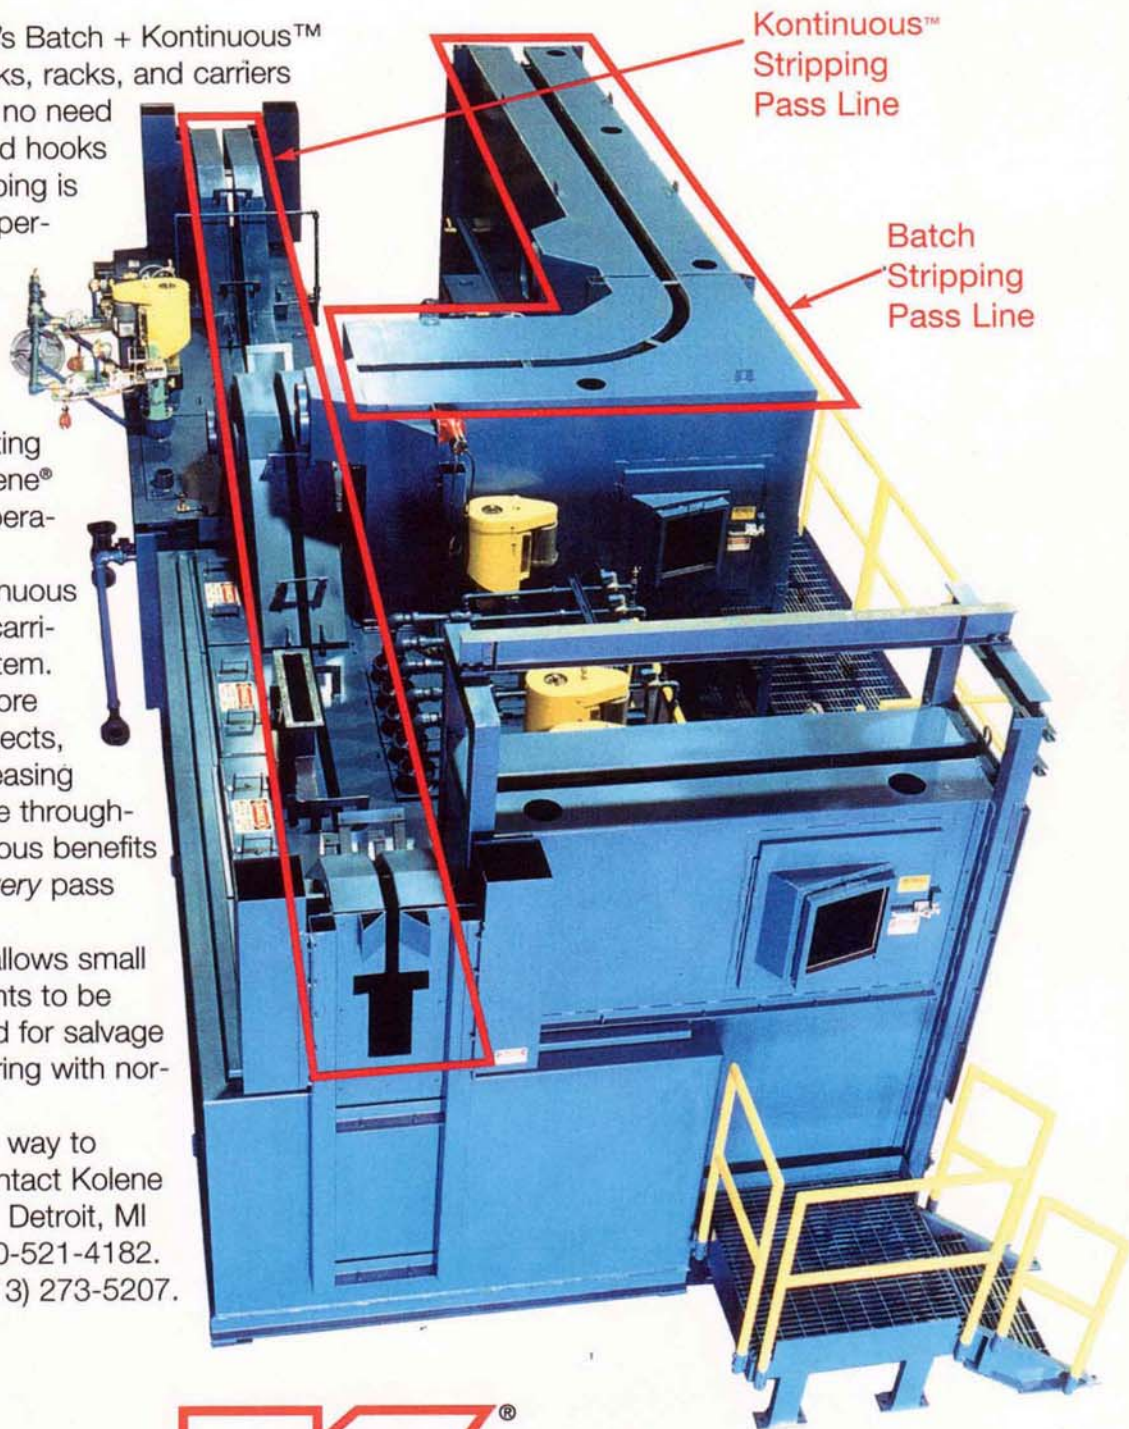

Enjoy the benefits of in-line stripping
along with the flexibility of batch reject
stripping in one integrated unit!

With the introduction of Kolene's Batch + Kontinuous™ salt bath stripping system, hooks, racks, and carriers are stripped in-line/on-line with no need to periodically remove racks and hooks from the production line. Stripping is thorough and complete and is performed at normal line speeds with no interruption in normal coating production. At the same time, small lots of reject coated components can be stripped for salvage and recoating without interfering with the Kolene® Kontinuous™ rack stripping operation.

All of the advantages of continuous stripping of hooks, racks and carriers are preserved with this system. Improved transfer efficiency, more uniform coating build, fewer rejects, and even the potential for increasing racking density and coating line throughput are some of the more obvious benefits of having 100% clean racks every pass through the line.

The batch stripping module allows small lots of reject coated components to be quickly and thoroughly stripped for salvage and recoating - without interfering with normal rack stripping.
